bachotex 2025 meeting

Outline

- Tagged pdf gets enforced upon us. Validators dominate over properly designed documents. What happened to rendering for specific target groups and purposes?
- Universities want documents to comply so they offer checkers. We managed to get them happy (after all, they are clueless about content) except for colors; show an example.
- However, the tool that we use is rather inaccessible. Take error messages. How accessible are they?
- But ... let's test this! We introduce several techniques, for instance QR codes. After all, this is the time of phones and we need to attract youth. Of course it now can become fashion to generate errors.
- But isn't it more challenging to use colors? How can they help us? We need to do some research!
- Tove's color pdf talk. A scientific experiment to determine if colors in pdf are really an issue. If not, we can move back to $\text{T}_{\text{E}}\text{X}$.
- Back to $\text{T}_{\text{E}}\text{X}$. We're going to do two tests: with QR tags and with colors. And in the end the user might decide. We also explore sound as feedback!
